

Forklift Fork Positioners

Forklift Fork Positioners - The fork positioner is actually a hydraulic device that can allow the the one driving to operate the forklift without leaving the seat. They are constructed out of high quality materials and are designed to endure the most demanding procedures and work environments. Side shifting models have the extra ability to laterally position the entire load or the arms so as to facilitate more exact carrying and placement in a quicker and more efficient method.

The unique fork pocket design could enable operators to securely sway the unit's blades without any worry of destroying the positioning cylinders. This could allow the operator the option to either perform independent or simultaneous blade movement, depending on the requirements of the job. For most lift trucks with non-OEM carriages, complete carriages are considered necessary. Standard OEM carriages could be converted into fork positioners on existing units.
