

Forklift Extension Booms

Extension Booms for Forklift - Normally, we view forklifts as industrial equipment used so as to lift and move pallets. Nevertheless, there are extensions available to give the forklift more strength and more length for heavier loads. By utilizing one of the four major lift truck booms, your forklift can be handy for different other applications. The four main lift truck booms are the shooting boom, the carpet boom, the coil boom and the pipe boom. Each of these are designed for attachment onto your lift truck.

Coil Poles

Able to connect to the forklift's carriage, coil poles are built to transfer rolled coils and other rolled materials like for instance concrete poles or reels of wire. Coil poles will allow you to transport any cylinder or rolled material too.

Carpet Poles

Carpet poles are a heavy duty accessory constructed from EN24T metal. They mount directly onto the forklifts' carriage. They are known as carpet poles but are also used so as to move other types of rolled floor coverings in addition to cylinder goods. They do not have the capability to lift heavy stuff such as coil poles or concrete pipes.

Shooting Forklift Booms or Telehandlers

Shooting forklift booms are also called telehandlers or telescopic booms. They are extremely useful on rough terrain lift trucks and lift to heights of 20-40 feet. These booms are usually used outside on construction jobsites or within the agricultural industry.

Booms Must Not Be Used On Pipes

Extreme damage can occur to the interior of a pipe when utilizing whatever kind of boom in order to move the pipe. It is suggested that a hauling sling be utilized in place of a pipe boom in this particular function. Sometimes, cylinder shaped pipes and steel pipes should be transferred utilizing a boom whenever a hauling sling is unavailable. In these cases, care should be taken to guarantee the pipes internal integrity.

Additional Types

There are two other booms that can be used by the lift truck and they both attach to the forks instead of the carriage. They allow an easy transition from pallet to coiled or rolled objects together with the additional benefit of providing a clear line of sight for the operator.

Guidance for Safety

Forklift operators must finish a training course to be able to learn how to drive the machinery in the most safe and practical manner. This training is intended to keep the operator safe and so as to avoid any injury to people working close by. Lift trucks are a heavy piece of industrialized machinery and considered to be a potentially dangerous machine. Individuals who work with and around them have to comply with and understand all of the safety measures.

Additional training should be provided to individuals who will be dealing with lift truck booms. This would make certain they know how to carefully operate the booms. Accidents have happened on the job from failure to safely work a boom. Some makers offer training courses on the various types of booms and some offer on-site training where employees can be trained directly where they will be working. This on-hand training enables the trainer an opportunity to tackle all safety concerns at that specific job location.
